Antioxidants are man-made or natural substances that may prevent or delay some types of cell damage. Diets high in vegetables and fruits, which are good sources of antioxidants, have been found to be healthy; however, research has not shown antioxidant supplements to be beneficial in preventing diseases.

Antioxidants are specific organic compounds that are active in the prevention of very rapid harmful chemical chain reactions with oxygen or nitric oxide, that is, oxidation reactions. In the body, oxidation reactions generally involve highly reactive molecules called free radicals. Free radicals reside primarily in the mitochondria of cells.

A free radical is a molecule with an unpaired electron (Afzal & Armstrong, 2002). The molecule is reactive and seeks another electron to pair. Free radicals are involved in the mechanisms of damage associated with disease development (Rice-Evans, 1999). Examples are hydrogen peroxide, hypochlorite, nitric oxide and nitrogen dioxide.
